**MULTISENSORY MATH
A Different Way of Thinking
About Teaching Math**

Marilyn Zecher

Originally based on the Orton-Gillingham approach of explicit teaching, Multisensory Mathematics combines the research-based Concrete-Representation-Abstract (CRA) approach to teaching mathematics with recommendations from the National Council of Teachers of Mathematics, the What Works Clearinghouse, the National Math Panel and Universal Design for Learning. Participants learn to apply this methodology in guiding students in a conceptually based program from foundation skills/ numeracy to place value, basic operations, fractions and decimals. Participants learn to use manipulatives effectively to reinforce concepts, aid memory and enhance performance for all students. The approach balances conceptual understanding with procedural fluency and incorporates strategies for helping students learn and retrieve math facts. Metacognitive structured procedures for computational accuracy. This approach is especially effective with students who learn differently, inclusion classes and ESL learners. The approach is effective for initial instruction as well as remedial work at all levels and is compatible with all curricula and programs.
